Multi Purpose for more Flexibility
For today’s modern farms the demands for cultivation have changed. Tight time slots have to be balanced with higher machine performance. Restricted crop rotations call for an adaption in techniques that accomplish all requirements of modern crop cultivation.

As one of the largest suppliers of plough and cultivator based soil preparation systems Kverneland uses its knowledge on the diverse requirements in cultivation and integrates this into all machine development steps.

One of today’s most important perceptions is that only with a wide range of implements can you fulfill all the requirements in soil preparation.

The Kverneland CTC cultivator is the machine that can meet all these needs.

**Targets of soil preparation**

After harvest shallow stubble cultivation is the most important step in the reduction of weeds. A uniform mixture of crop residues and firm recompaction increase the volunteer germination rate in dry weather conditions.

The following working steps aim for several goals of crop cultivation. Crop residues need to be uniformly mixed throughout the full working depth. Additionally any compaction of the soil needs to be removed. If the main focus of the cultivation operation is especially to reduce weeds, the timing of cultivation is most important. This is also the case when combating slugs and mice. If for example the soil is only shallow cultivated in dry conditions, the cultivation will only have minor effects on the slug population.
Kverneland CTC, flexibility to meet all demands

The tasks of modern soil preparation are multifunctional. Additionally farmers have to meet their specific needs which are predetermined by location and farming practises.

The equipment possibilities of the Kverneland CTC are as versatile as your demands, with a choice of different implement combinations and variants. Kverneland offer the possibility to equip the CTC to meet your individual needs.

The Kverneland CTC offers total flexibility with:
- 1 possible tine spacings
- 2 tine variants
- 8 types of shares
- Front Cutting or Mixing discs
- 4 types of levelling devices
- 5 types of rear roller

Excellent manoeuvrability e.g. on headlands
The CTC equipped with 3 rows of tines positioned at either 270mm spacing. The Quantum share (345mm), ensure that the entire working width of the machine is cultivated even when the machine is adjusted for shallow work. The high inter-row clearance up to a maximum of 150cm and the underbeam clearance of 87cm ensure blockage-free operation under any conditions (maize, sunflower, wheat, oil seed rape stubbles).

The outer wing frame segments are pre-loaded by hydraulic accumulators and can be adjusted to suit the various field conditions.

A maximum working depth of 30cm is possible.
Front Depth Adjustment
The front working depth is adjusted by the depth control wheels. The 340/55×16 tyres ensure excellent support in light conditions. A floating drawbar ensures full ground contour following and can be equipped with a ram for lifting the machine parallel.

Rear Depth Control
The rear depth control of the Kverneland CTC is adjusted via the roller equipment. The parallelogram frame concept enables the working depth to be easily adjusted. The hollow discs or harrow sections are simultaneously adjusted with the roller, if necessary fine tuning of the levelling tools can also be achieved. Therefore the adjustment of the working depth is simple and user-friendly.
Front Mixing Disc (FMD)

The FMD system has notched hollow discs which are ideal when working in high amounts of crop residues. The FMD system pre mixes any straw standing on the top of the stubble to ensure thorough mixing by the stubbling tines for improved incorporation.
Kverneland has developed a front disc system to cut or incorporate crop residues in front of the cultivator tines.

The disc system has central screw depth adjustment, and individual rubber disc protection. This overload system allows the disc to follow the ground contour very well.

The front disc options are available for CTC with 3 rows of tines.

The Front Mixing Disc (FMD) option is the ideal equipment that avoid any boiling effect in front of the tine especially with short wheat straw.

As the working depth of the discs section is limited to 5cm, the required pulling force is always insignificant.

**Front Cutting Disc (FCD)**

The FCD system has notched straight discs which are mounted in front of the first row of tines. The FCD system is ideal when working in maize straw for example, where the disc is cutting the straw directly in front of the tines.

The straw is cut to improve the flow of material and prevent the machine from blocking.
High Flexibility
One of the main advantages of the hollow tine technology is the ability to flex sideways by up to 20cm helping to bypass obstacles below the field surface. Fields are rarely 100% square and the sideways forces for standard forged and full material tines produce a lot of stress to the tine holder system and consequently to the frame structure. To avoid this stress on all components Kverneland think strong rather than big: The natural quality of fine grain steel and the use of our proven heat treatment process can provide immense strength to a simple piece of tube. Being flexible this tube can then „flex around“ obstacles and erase stress peaks by dispersing it throughout the implement.

Maintenance-free Zone
The CLC tine is a maintenance–free zone. All components are heat treated and produced from a very high quality hardened steel. These parts are then able to sustain high pressure and friction without the need for any greasing. Greasing is both costly and time consuming and in some cases greasing parts can cause even more damage (at its worst grease attracts fine dust and encourages wear) than providing protection. Therefore Kverneland always minimises the need for greasing points when designing their machines.

A Special Angle
The tine shape with two working angles guarantees an efficient penetration. The first zone lifts the soil for a good loosening. The second zone with little power requirement ensures an efficient and homogeneous mixing.

Kverneland offer a wide selection of shares including the new Knock-on patented system. The CTC now uses a unique “C” tine design and can be equipped to suit all needs in all crops every season, every year!

NEW! Quantum share 345mm - always in combination with Knock-on or Tiger carbide point 80mm. It has been designed for use especially against hard soil. The action of the 80mm point combined with the 345mm wing share ensures perfect penetration, and complete flat cutting for a homogeneous weed regrowth.
A New Jack Hammer

**Leaf spring**

The renowned Kverneland Auto-reset leaf spring system (same as on the ploughs) guarantees high reliability as well as low maintenance costs. Being a real 3D safety system, the Kverneland leaf spring system allows movements up to 35cm and thus supports perfect cultivation results even at a deep working depth.

With a 640kg weight, the tines are kept at a stable position under all soil conditions, which ensures constant depth control. The piano effect, where the tines move back and forth, is minimised and fuel consumption is reduced to a minimum.

**Vibromat shear bolt system**

As an alternative to the auto-reset leaf spring, a unique shear-bolt system is also available. The leaf spring is replaced by a plate holding a standard 12mm shear bolt through the leg. With the tine being so flexible the leg can bend backwards 10cm and reach up to 2 tons pressure at the point before the bolt shears. This effect is named Vibromat®, and anticipates untimely breaking of bolts and therefore helps to reduce down time.

**Patented Tine Holder**

This tine holder system consists of squeezing a U-shaped plate onto the frame beam by means of a single bolt. This U-plate is 100mm wide and enables the tine to be located deep onto the main frame.

One of the many advantages of bolted tine carriers is the reduction in the volume frame weakening welding required. With the tines being light (35kg) and fitted with a single bolt, it is very easy to take them off to adapt the cultivator to the working conditions and the tractor available.

---

NEW! 2 new types of carbide points - 80mm and 150mm Tiger point. The special design ensures progressive and high penetration and requires low pulling force. The special shape of the carbide plate resist against aggressive stony conditions. All points available with Knock-On deflectors too.

Soil friendly

When work has to be done the machine should provide the best possible effect and cause the least damage to soil structure. Therefore, the Knock-on system offers a wide range of deflectors and tine protections which can be more or less active in boiling and breaking down aggregates.

The Knock-on range is full of possibilities offering 6 cutting widths with 80, 150, 250, 320mm shares and 345mm Quantum share to match with various tine spacing and depth requested.

In wet soil a wide deflector should not be used. A narrow protection plate will produce smaller aggregate maintaining soil structure. This in addition will save fuel. However in optimum conditions a good boiling effect will be possible with the wide deflector.

In order to make it easy and fast, the deflectors are locked by a single bolt.

With Knock-on minutes become seconds!

To change the points on a 3.00m unit with 10 tines it takes 1 minute and 30 seconds - whilst only 20 minutes are needed with bolted reversible shares.

QR-Code: Video Knock-on
Economic...

The bulb shape on the shares protects the holder system by decreasing the soil pressure on it. The holder can take several shares before it has to be changed, reducing the downtime dramatically.

If the soil is wet or dry the shares will not behave the same way:
1. In dry soil, the point wears down to the end, the bulb continues to protect the holder.
2. In humid soil, the point wears thin but will not lose its shape. When a hole appears its time to consider changing the point.

…and Ecological

As a comparison, a standard reversible point (1300 g) worn out after having done the same number of hectares (been reversed half way) as the Knock-on parts above. With the Knock-on system, up to 75% of the original part can be used, in comparison to standard points where only 60% can be used. This saves more than 200 g of steel each time a point is changed. Thousands of Kverneland tines will contribute to savings a lot of steel and energy!

James Nott is farming a 900 ha farm near Sudbury in the UK and has been using the Knock-on system on his Kverneland CTC for 2 years. “The Knock-on system is simple, quick and easy, we like the extra depth the new point and holder gives the CTC. As the metal wears it does not lose its shape. In all soil types and conditions penetration is excellent.”
**Perfection until the End**

**Levelling discs:**
- Rubber spring loaded, to follow the ground and protect
- Border discs as standard
- Disc linked to the roller via a parallelogram. The disc will stay at same position for levelling when changing working depth
- Easy adjustment via turnbuckle to set up disc position

**Levelling tines:**
- Good levelling capacity
- Good following of the ground contour
- No risk of soil blockage
- Easy to adjust
- Very low loading capacity

**Double cage roller 400mm (tube/flat)**
- 10 bars for a good loading capacity and operation in wet conditions
- Effective crumbling action
- 160kg/m

**Cage roller Ø 550mm**
- Good levelling capacity
- Good following of the ground contour
- No risk of soil blockage
- Easy to adjust
- Very low loading capacity
- Good carrying capacity
- 90kg/m

**Actiflex Ø 580mm**
Kverneland introduces a new generation of roller called the Actiflex, specially designed to match with all types of conditions. Its intensive mixing effect combined with a good recompaction makes this roller the ideal tool for the best volunteer’s regrowth. Its large diameter of 580mm ensures a good driving effect even in light soils. This roller is definitely a good compromise between the weight (160 kg/m) and mixing performances.

**Double cage roller 400mm (tube/flat)**
- Good crumbling
- Precise depth control
- Good levelling effect
- Good carrying capacity
- 160kg/m

**Actiflex Ø 580mm**
- Combination of a single disc gang with all roller types
- Intensive mixing and incorporation, well adapted to high amount of residues
- Very good levelling capacity
- 160kg/m

---

**Cage roller Ø 550mm**
- Good levelling capacity
- Good following of the ground contour
- No risk of soil blockage
- Easy to adjust
- Very low loading capacity
- 90kg/m
Active Rollers - a Second Soil Preparation Tool

Actipack: A second preparation tool!
The Kverneland Actipack roller displays its superb working qualities especially on medium to heavy soils. The integrated cutting discs break the larger clods whilst the adjustable knives cut the remaining clods resulting in optimal clod breakdown. The pressure on knives can be set as high as that of the disc to provide equal firming on the entire working width. An “Off” position allows the knives to be lifted completely to leave a rougher surface and help protect the top layer of soil from capping and erosion.

Actiring: Strong and light!
The Actiring roller is a lighter variant of the Actipack, using the same frame structure and knife system. The discs have been replaced by a “V” profile ring, this saves 60kg/m, which is of critical importance for reducing lifting requirements for mounted equipment. This new design will also provide a lower cost alternative to the Actipack especially in lighter soil conditions where the additional features of the Actipack are not required. The wider shallow angel of the V profile is less aggressive than that of the Actipack disc design resulting in a better load carrying in medium to light soil conditions. The springs and knives have been especially designed to prevent stones getting into the rotor and causing blockages.

Actipack and Actiring: 4 different pressures can be applied on the skids depending of the soil nature and the required finish.

Skids up (not active)

Skids down (active)
With today's large scale farms spread over wide distances it is often necessary to drive long distances between fields.

Therefore the Kverneland CTC can be lowered for transport for improved handling. The CTC frame incorporates an hydraulic chassis suspension system as standard. The CTC also has the option of hydraulic or pneumatic braking systems which allow the machine to meet road transport regulations, especially when travelling at high road speeds that are achievable with today's modern tractors.

Quick on the road and quick in the field. The CTC can easily be converted from transport to work position. The hydraulic transport locking device unlocks automatically when unfolding.

Always the safety first!

Depending of the country, Kverneland proposes 3 different wheel axles: without brake, hydraulic or pneumatic brake.

2 types of wheels are available according to the soil conditions and season of use: 400/60 x 15.5 or 480/45 x 17 for better carriage capacity and then reducing the soil compaction.
a-drill (200 & 500 Liter)

Stubbling and Seeding in one Pass

The position of the Distribution outlet is before the roller. Position and angle are adjustable.

Fans adapted to Seeds, Working Speed and Width
- The SH series can be equipped with two types of fan:
- An electric fan recommended for small seeds and allowing seed rates of 4 kg/min (for a machine 50kg/ha - 4m working width at 12km/h)
- A hydraulic fan for flow rates up to 14 kg/min
Seeders for Cover Crops: One Response to the Nitrate Directive

The EU nitrate directive aims to protect water resources so-called vulnerable with a rate higher than 50 mg nitrate/l. One of the measures taken into account to avoid leaching, resulting in the generalization of the soil cover in the fall by vegetation cover, which will absorb nitrogen from the soil and air, to convert it into organic nitrogen. The cover crops will then release nitrogen to the next crop (1/3), protect soil against erosion and improve its structure.

A-drill 200 and 500 with 200l resp. 500l hopper capacity have been designed to meet a rapid implementation of cover crop during stubble operations while minimizing their costs. In addition, they can also be used for establishing rape or mix of different diameters seeds (leguminous plant, crucifers, ...).

Precision and High Work Output

Two models are available depending on the seed rate/ha and the output of the machine: The a-drill 200 will be used for rather small seed sizes with a low seed rate/ha, whereas the a-drill 500 would be preferred with higher seed rate (25 to 50 kg/ha - mix of seeds, grass, etc ...) in order to maintain a significant autonomy even with wide machines. Both models have 8 outputs which will spread the flow of seeds uniformly over the working width.

Seed Metering Rotors for all Conditions

The a-drill 200 and 500 are delivered with two types of rotor: one for small seeds (rape, mustard, cabbage, clover, etc ...), and a medium rotor for seeds (vetch, grass, sunflower, ...). The agitator placed above the rotor ensures a steady stream of seeds. A brush, located at the base of the rotor, will regulate the flow and improve the setting accuracy. For large seeds (peas, horse beans, etc ...), it is strongly advised to choose the Flex rotor option, which is able of deforming with large seed diameter.
Always the Correct Linkage!

**Cross shaft**  
Cat. III or Cat. IV  
The crossshaft allows an angle of steering lock of up to 180° for an excellent manoeuvrability.

**Ball coupling ø80 mm**  
The ball coupling ensures a linkage without any gap and allows to work in hilly conditions up to +/- 30°.

**Fix pulling eye ø 50mm**  
It is used to link the CTC to a fixed hitch.

**Pivoting pulling eye ø50mm**  
It is used on fixed hitch and allow to work in hilly conditions.

**Please note:**

- For tractors equipped with twin wheels or wide wheels, the machine can get a drawbar extension of 85 cm to ensure short turns in headlands.
- The machine equipped with a fix eye must get the parallel lifting.

Kverneland Group

Kverneland Group is a leading international company developing, producing and distributing agricultural machinery and services.

Strong focus on innovation allows us to provide a unique and broad product range with high quality. Kverneland Group offers an extensive package aimed at the professional farming community, covering the areas of soil preparation, seeding, forage and bale equipment, spreading, spraying and electronic solutions for agricultural tractors and machinery.

Original Spare Parts

Kverneland Group spare parts are designed to give reliable, safe and optimal machinery performance - whilst ensuring a low cost life-cycle. High quality standards are achieved by using innovative production methods and patented processes in all our production sites.

Kverneland Group has a very professional network of partners to support you with service, technical knowledge and genuine parts. To assist our partners, we provide high quality spare parts and an efficient spare parts distribution worldwide.
